The present paper deals with two new species of Phlaeothripidae from Hengduan Mountain, China. The specimens are collected by the Comprehensive Scientific Expedition to the Hengduan Mountain, Academia Sinica. The type specimens are kept in the Institute of Zoology, Academia Sinica. All measurements are in microns.

## Apterygothrips brunneicornus Han sp. nov. (fig. 1: A-F)

Allied to Apterygothrips hispanicus (Bagnall) 1916, but may be distinguished from the latter by following pionts: (1). New species antennal segments brown, only segment III basal half yellowish brown, (hispanicus antennal segments I-II and VII-VIII brown, segment III yellow, IV VI yellowish to light brownish-yellow); (2). Antennal segment III with I sense cone (hispanicus with 2 sense cone); (3). Occili absent (hispanicus ocelli present); (4). Prothorax about 1.5 times as broad as long, the bristles at posterior angles 0.27 as long as prothorax, the epimeral bristles pointed at tips, (hispanicus prothorax about 2 times as broad as long, the bristles at posterior angles 0.4 as long as prothorax, the epimeral bristles dilated at tips); (5). Mesopraestermus incomplete, with an intermitrent medium, two lateral plates very little, (hispanicus, mesopraesternum incompete, restricted to two triangular lateral plates).
